FAQs

1. What are the different types of expressions?
● There are three types of expressions based on the position of operators.
● They are:
1. Infix expression
2. Prefix expression
3. Postfix expression

2. Give examples of all types of expressions.
● Infix: a + b — operator is written between operands.
● Prefix: + a b — operator is written before operands.
● Postfix: a b + — operator is written after operands.

3. Which data structure is used for evaluation of expression?
● Stack is used for the evaluation of expressions.
● Stack follows the LIFO (Last In, First Out) principle.
● It is commonly used for postfix and prefix expression evaluation.

4. Convert infix expression a+b+c+d to prefix expression.
● Infix expression: a + b + c + d
● Prefix expression: +++abcd
● Here, the operators are placed before the operands.

5. Convert infix expression a+b+c+d to postfix expression.
● Infix expression: a + b + c + d
● Postfix expression: ab+c+d+
● Here, the operators are placed after the operands.
